

## Neural Style Transfer

## Content cost function

Content cost function

$$J(G) = \alpha \underbrace{J_{content}(C, G)}_{\text{Usually I is chosen to be somewhere between in the middle of the layers of the neural network, neither too shallow nor too deep$$

- Say you use hidden layer *l* to compute content cost.
- Use pre-trained ConvNet. (E.g., VGG network)
- Let  $\underline{a^{[l](C)}}$  and  $\underline{a^{[l](G)}}$  be the activation of layer l on the images
- If  $a^{[l](C)}$  and  $a^{[l](G)}$  are similar, both images have similar content

$$\int content \left( C, C \right) = \frac{1}{2} \left[ \frac{1}{2} \left[ \frac{1}{2} \left[ C \right] \right] - \frac{1}{2} \left[ \frac{1}{2} \left[ \frac{1}{2} \left[ C \right] \right] \right] \right] \\
= \frac{1}{2} \left[ \frac{1}{2} \left[ \frac{1}{2} \left[ \frac{1}{2} \left[ C \right] \right] \right] - \frac{1}{2} \left[ \frac{$$
